Safety Instructions

This unit has been designed and tested in accordance with the EC Certificate of Conformity and has left the manufacturer's plant in a condition fully complying with safety standards.

To maintain this condition and to ensure safe operation, the user must observe all instructions and warnings given in this operating manual.

Safety-related symbols used on equipment and documentation from R&S:

							
Observe operating instructions	Weight indication for units >18 kg	PE terminal	Ground terminal	Danger! Shock hazard	Warning! Hot surfaces	Ground	Attention! Electrostatic sensitive devices require special care

- The unit may be used only in the operating conditions and positions specified by the manufacturer. Unless otherwise agreed, the following applies to R&S products:
IP degree of protection 2X, Pollution severity 2, overvoltage category 2, altitude max. 2000 m.
The unit may be operated only from supply networks fused with max. 16 A.
- For measurements in circuits with voltages $V_{rms} > 30$ V, suitable measures should be taken to avoid any hazards.
(using, for example, appropriate measuring equipment, fusing, current limiting, electrical separation, insulation).
- If the unit is to be permanently wired, the PE terminal of the unit must first be connected to the PE conductor on site before any other connections are made. Installation and cabling of the unit to be performed only by qualified technical personnel.
- For permanently installed units without built-in fuses, circuit breakers or similar protective devices, the supply circuit must be fused such as to provide suitable protection for the users and equipment.
- Prior to switching on the unit, it must be ensured that the nominal voltage set on the unit matches the nominal voltage of the AC supply network.
If a different voltage is to be set, the power fuse of the unit may have to be changed accordingly.
- Units of protection class I with disconnectible AC supply cable and appliance connector may be operated only from a power socket with earthing contact and with the PE conductor connected.
- It is not permissible to interrupt the PE conductor intentionally, neither in the incoming cable nor on the unit itself as this may cause the unit to become electrically hazardous.
Any extension lines or multiple socket outlets used must be checked for compliance with relevant safety standards at regular intervals.
- If the unit has no power switch for disconnection from the AC supply, the plug of the connecting cable is regarded as the disconnecting device. In such cases it must be ensured that the power plug is easily reachable and accessible at all times (length of connecting cable approx. 2 m). Functional or electronic switches are not suitable for providing disconnection from the AC supply.
If units without power switches are integrated in racks or systems, a disconnecting device must be provided at system level.
- Applicable local or national safety regulations and rules for the prevention of accidents must be observed in all work performed.
Prior to performing any work on the unit or opening the unit, the latter must be disconnected from the supply network.
Any adjustments, replacements of parts, maintenance or repair may be carried out only by authorized R&S technical personnel.
Only original parts may be used for replacing parts relevant to safety (eg power switches, power transformers, fuses). A safety test must be performed after each replacement of parts relevant to safety.
(visual inspection, PE conductor test, insulation-resistance, leakage-current measurement, functional test).

7. Testing and Repair of the Board

7.1. Function Description

The E6GHZ board extends the frequency range of the SMIQ03 by the range 3300 to 6400 MHz.

The IQ300 signal at X504 from the IQMOD module (300 MHz, IQ-modulated) is up-converted to 900 MHz using MIXER2 (IF900). Unwanted mixer products at the output of MIXER2 are filtered off by means of bandpass filters.

The REF600 signal at X502 from the reference/step synthesis (600 MHz) is doubled and serves as LO for MIXER2 (1200 MHz).

MIXER1 converts IF900 to the range 3300 to 6400 MHz. The LO signal (4200 to 6000 MHz) for MIXER1 is generated by doubling the FIQOUT signal of the IQMOD at X505.

Unwanted mixer products at the output of MIXER1 are suppressed by means of bandpass filters and a switched filter bank containing bandpass filters and tunable highpass and lowpass filters in 4 paths.

A level control element (LEVEL PRESET) preceding the filter bank permits to set the operating point of the amplitude modulator (instrument calibration routine Level Preset). Following the filter bank, the output level of the instrument is set by the amplitude modulator.

The thin-film unit POWERUNIT includes the output stage and a detector, which detects the output level of the instrument for the frequency range 3300 to 6400 MHz. There, the signal from the IQMOD (FIQOUT at X505) is also directly through-connected to the module output (IQOUT6 at X506) for frequencies < 3300 MHz.

7.1.1. Input REF600

The REF600 signal at X502 (600 MHz, 13 dBm) is split up via a power divider, taken via an amplifier and again provided as output signal at X501 REF600E for IQMOD (600 MHz, 13 dBm) and doubled as LO signal for MIXER2 to 1200 MHz, filtered and amplified to a controlled LO level of 17 dBm.

7.1.2. Input IQ300

The IQ300 signal at X504 (300 MHz, -9 dBm) is split up via a power divider, taken via an amplifier and again provided as output signal at X503 IQ300AUX (300 MHz, -9 dBm) and is used as RF signal for MIXER2 (level -12 dBm).

7.1.3. IF900 - IF Signal of Mixer2

The IF signal of MIXER2 (900 MHz) is filtered and amplified and taken to the RF connector of MIXER1 (level -12 dBm). The RF level at X2 is adjusted to -12 dBm by means of LEVEL IF900 (R848).

7.1.4. LO Conditioning for Mixer 1

For LO conditioning, the FIQOUT signal is doubled by the POWERUNIT at X9 from 2100 to 3000 MHz to 4200 to 6000 MHz. For suppression of subharmonics, the lowpass filter LP5100 is cut in at frequencies at FIQOUT < 5100 MHz. A level control ensures a constant LO level at X1 (17 dBm).

7.1.5. RF Path at IF Output of Mixer1

The mixer output signal (-18 dBm) is taken via amplifiers and filters to the level preset control element and via the filter bank and the AM modulator to the input X6 of the POWERUNIT. The amplifier stages have a gain (S21) of approx. 8 dB each, thus compensating for the filter attenuations.

7.1.6. Filter Bank

The tunable filters are set according to the frequency; the necessary data is determined in the module test in the production and contained in the EEPROM of the module.

Each tracking filter is driven by a tuning voltage. IQFILT1 and IQFILT2 drive the lowpass filters, IQFILH1 and IQFILH2 the highpass filters. In the deactivated filter paths, the respective lowpass filters are set to minimum and the highpass filters to maximum tuning voltage via selector switches (0 or 20 V).

The four control bits FILOFF1 to FILOFF4 check the selector switches and the ON/OFF functions of the filter paths.

There are four frequency ranges:

Frequency range	SMIQ output frequency	FIQOUT from IQMOD	LO frequency Mixer 1	Sideband	Control signal LP5100_ON
FB1	3300 to 4200 MHz	2100 to 2550 MHz	4200 to 5100 MHz	lower	L
FB2	4200 to 5100 MHz	2550 to 3000 MHz	5100 to 6000 MHz	lower	H
FB3	5100 to 6000 MHz	2100 to 2550 MHz	4200 to 5100 MHz	upper	L
FB4	6000 ... 6400 MHz	2550 ... 2750 MHz	5100 ... 5500 MHz	upper	H

7.1.7. RF Level Control

The command value for the amplitude modulation ($f > 3.3$ GHz) and the level control is applied to the module via X500.A2 UREFAM. At frequencies < 3.3 GHz, the control bit AM_ON switches over to a command value generated on the module, since the amplitude modulation is already generated on the IQMOD module. The temperature-compensated and linearized detector output voltage is applied as actual value to the control amplifier N29, which drives the AM modulator.

The level linearity is adjusted using trimmers RF DC ZERO (R394) and DETECTOR OFFSET (R173). The nominal value for the level control is set via D/A converter D2. The control bandwidth is switched over via control bit AM_SLOW_ON. For the IQ mode or in the operating mode "ALC OFF MODE TABLE", the AM modulator is controlled by the level D/A converter (ALC_ON = Low, DETOUT_ON = Low), N29 will then operate as amplifier.

7.1.8. Diagnosis

Diagnosis voltages determined via RF rectifiers feature large tolerances and can only be used as indicators (RF level present / not present). RF test points without directional couplers do not detect the forward power, but the RF voltage, which is to a large extent dependent on the matching (impedance) and therefore features large fluctuations versus the frequency.

7.2. Measuring Instruments and Auxiliary Means

- DC voltmeter, ammeter (e.g. UDS5)
- RF power meter (e.g. NRVD)
- RF spectrum analyzer up to 20 GHz (e.g. FSM)
- RF network analyzer up to 8 GHz (e.g. ZVC)

7.3. Troubleshooting

For first error diagnosis it is recommended to use the test program included in the service kit, which offers comprehensive possibilities.

Before starting more detailed troubleshooting in the RF paths, it is recommended to check the serial interface for correct data transmission and the diagnosis, reference, operating point and control voltages for the correct value.

7.3.1. RF Level

7.4. Testing and Adjustment

All measured values with no tolerance indicated are meant to be understood as reference values.

Plug the board onto the adapter included in the service kit and set up the RF connections. The adapter can then be plugged into the chassis together with the board.

Before carrying out any tests, set the instrument to a defined initial status by means of PRESET.

7.4.1. Testing the Data Transmission

The board is addressed via the serial interface. Subaddress 1 is used for the data transmission, . Subaddress 2 is used for reading and writing to the EEPROM, which contains calibration data for the filter control.

Testing: When changing between the frequencies $f_1 < 3.3 \text{ GHz}$ and $f_2 > 3.3 \text{ GHz}$, the bit SWE6-ON at D14/4 must change between low and high.

7.4.6. Testing the Tuning Voltages

The diagram shows general characteristics of the tuning voltages. Individual calibration data may deviate from this curve; usually, there are deviations from the smooth tuning characteristics because of the calibration process. The upper curves show IQFILH1 and IQFILH2, the lower ones IQFILT1 and IQFILT2 (identical in this case). All 4 voltages can be read out via the diagnosis (Udiag = 20V * DACWERT/4095).

7.4.7. Testing the RF Signal Paths

The module accommodates SMP or MMCX test connectors X1 to X9. At these coaxial interfaces, matching and gain can be measured using a network analyzer, for example. For this purpose, the coupling capacitor, which is located at this place in the signal path, must be soldered from the desired input or output to the test connector. In addition to a number of coupling capacitors in the signal path, there are grounded through-connections (GND). There, it is possible, e.g. to solder in a coaxial cable and connect its inner conductors to the signal path. For specifications of nominal gain or nominal level please refer to the block diagram. S-parameter measurements in the frequency range 3 to 6 GHz require extensive equipment and knowledge. Therefore, such measurements should only be performed by trained personnel.

7.4.8. Adjusting the Drain Current of A510 in the POWER UNIT

Cut in the ammeter at X14.1 - X14.2.

Use trimmer R172 to adjust the current to 500 ± 5 mA.

7.4.9. Adjusting the Reference 10 V

Use trimmer R608 to adjust to $10 \text{ V} \pm 0.001 \text{ V}$ at the test point X20.4.

7.4.10. RF-DC-ZERO Adjustment at Output Detector

Remove jumper at X14.1-X14.2, set the voltage at X16.1 (reference X16.2) to $-17 \text{ mV} \pm 0.5 \text{ mV}$ using potentiometer R394, plug in the jumper at X14.1-X14.2.

7.4.11. Adjusting the RF Level Linearity

Instrument settings: PRESET, RF 3301 MHz, LEVEL 2.1 dBm, LEVEL/LEVEL/ATTENUATOR MODE FIXED.

Connect power sensor of power meter to RF connector of SMIQ.

Save the measured value as reference value on the power meter and select the Δ dB display. Set LEVEL -18.1 dBm.

Use potentiometer R173 to adjust the DETECTOR OFFSET to 20-dB drop on the power meter.

By adjusting alternately using potentiometer R173 and potentiometer R394 (RF-DC-ZERO), the level deviation from the nominal value can be minimized in the level range -20 dBm to 13 dBm.

7.4.12. Adjusting the IF900 Level

Remove the module, unscrew the screening cover.

Unsolder the coupling capacitor C663 from the signal path and solder in such that R625 is connected to X2.

Place the module onto the service adapter, set up the RF connections, install the adapter into the instrument. Make sure to allow for sufficient cooling of the module, since the cooling effect of the screening covers and the air current is missing.

Instrument setting PRESET, RF 3301 MHz.

Connect a power meter to X2 and measure the level (f = 900 MHz). Adjust the RF level at X2 to -12 dBm using LEVEL IF900 (R848).

7.4.13. Calibration of the Tunable Filters

The filters are calibrated in the factory in the module pretesting. This is necessary when replacing tuning diodes in the tunable filters or the EEPROM.

7.4.14. Tables and Interfaces

7.5. Disassembly and Assembly

After opening the instrument, unlocking the module and loosening the RF connections, the module can be taken out of its slot. The screening covers of the module are fastened with screws; loosen the screws of the upper cover first and tighten them last.

For mounting the POWERUNIT observe the mounting instructions (see component location plan).

7. Testing and Repair of the Module

7.1 Function Description

The IQ-Converter module (IQCON) can be operated either in the vector modulation or the CW mode.

With vector modulation selected, (IQ-mode) the module converts the IQ-modulated 300-MHz input signal (X223) of the IQ modulator (IQMOD board) to the frequency range 750 to 3300 MHz. The frequencies 750 to 1500 MHz of the summing module or SMT synthesizer (input X221) are used as LO signal. These frequencies are doubled in a second path in order to obtain the required frequency spectrum of 1050 to 3000 MHz at the LO. The tunable bandpass filters from 750 to 3300 MHz are provided to filter the unwanted sideband and all other frequencies occurring with mixing. A level control element (Level Preset) in conjunction with fixed adjustments in the three filter paths are provided to compensate for the level tolerances occurring as well as for the level frequency response. The calibration data required for setting the filters are stored in an EEPROM accommodated on the board. In CW mode, the LO signal is routed via a pin diode switch and a solid-jacket cable W22 to the output amplifier. The frequency spectrum ranges from 450 to 3000 MHz. The frequencies from 3000 to 3300 MHz are obtained by mixing in the IQ path. In both operating modes, the output amplifier supplies the required output level of 4 dBm.

The module can be subdivided into the subsequent function units:

- harmonic filter
- frequency doubler and filter for the subharmonics
- LO amplifier with switch-selectable level control
- bypass for CW mode
- mixer and low-noise broadband amplifier
- tunable bandpass filters
- RF switch and output amplifier
- control and EEPROM

7.1.1 Harmonic Filter

(circuit diagram, sheet 2)

The tunable harmonic filter filters the harmonics of the output signal of the summing module or the SMT synthesizer in the frequency range 450 to 1500 MHz.

Eight capacity diodes V153 - V160 arranged in parallel anti-serially in the two poles of the Cauer filter, are provided as tunable filter elements. The two poles of the filter are tuned via the common tuning voltage OWFIL.

The pin-diode switches V32-V37 are provided to switch over to the doubler path.

7.1.2

Doubler Path

(sheets 3 and 4 of circuit diagram)

The SMD component SFD 1001 (N8) is provided as frequency doubler for generation of the frequency octave 1500 to 3000 MHz. The required input level 10 dBm of the fundamental wave (750 to 1500 MHz) is generated using the integrated GaAs-FET amplifier N17. Its working point is controlled by means of the transistor V30. Spurious which occur with frequency doubling are suppressed to -74 dBc by a combination of two switchable highpass filters and two tunable lowpass filters. The necessary amplification of level as well as decoupling of filters is accomplished by the use of bipolar amplifiers with a gain of 7 dB, each (V148 - V150). Their current in the working point is controlled via the transistors V27, V28 and V31.

The capacity diodes V191-192, V198-201 and V180-185 are used as tuning elements of the filters. They are adjusted by means of the DC voltages TUNEVD, TUNEVD2 and VDFIL.

The different levels in the doubler path and in the harmonic filter path are adjusted using the potentiometer R694.

7.1.3

LO Amplifier and Level Control

(sheet 5 of circuit diagram)

The GaAs-Fet amplifier (V106) provides the 17-dBm level required for control of the LO input of the mixer. It can be switched off in CW mode.

The total gain of the four-stage amplifier chain is approx. 34 dB. The prestages are set up using the bipolar transistors V186 and V147 and the GaAs-Fet transistor V107. All currents are controlled in the working point. (V3-V6).

The level deviations occurring throughout the entire LO path are compensated by a control. A pin-diode modulator (V42 and V38) is used as control element for amplitude control. This modulator is controlled by the PI control amplifier N18. The rated level is provided via the potentiometer R494. The detector diode V59 allows for measuring the RF level. A similar diode (V58) is used for temperature compensation. The bandwidth of level control is approx. 5 to 100 kHz.

7.1.4

Bypass for CW Mode

(sheets 5 and 13 of circuit diagram)

After passing the LO prestages, the signal is routed via the solid-jacket cable W22 to the output stage using the two pin-diodes switches V39-41 and V46-48. Since the output frequency is offset by 300 MHz in the IQ mode, the latter must provide an attenuation of approx. 70 dB to avoid that the LO frequency applied to the switch occurs as a non-harmonic spurious.

(sheet 6 of circuit diagram)

The IQ mixer (U8) is the nucleus of the IQ converter. It generates the IQ-modulated output frequencies between 750 and 3300 MHz. Due to the high output frequencies, the mixer is operated in inverted mode. The 300-MHz signal (-11 dBm) generated by the IQ modulator is applied to the IF input of the mixer. The mixer suppresses the mixing products up to ± 300 MHz offset from the carrier, since they are not filtered.

The lower sideband of mixing is used for output frequencies up to 1800 MHz.. Frequencies above 1800 MHz are up-converted. The upper sideband is used above 1800 MHz in order to obtain the frequency spectrum up to 3300 MHz.

The output frequencies (750 to 3300 MHz) at the RF port of the mixer are amplified by approx. 10 dB by means of the succeeding broadband amplifier (travelling-wave amplifier with transistors V100-V102). The second succeeding stage with the GaAs-Fet V109 increases the level again by approx. 11 dB. At both stages, the current in the working point is controlled via the transistors V21 and V23.

The following fixed 7th-order Cauer highpass has a cut-off frequency of 700 MHz and suppresses unwanted fixed mixing products.

Level Preset (level control element V54) is intended to be used for compensating the level frequency output of the IQ path and the temperature drift. In a calibration routine, the level is corrected within a fixed frequency stepping until the rated level of 4 dBm is reached at the output. The level detector (V61, sheet 13 of circuit diagram) is used as test point. The level control element is set via a current source with difference amplifier (signal LPRE1, V24-V26)

The tunable bandpass filters filter the unwanted mixing products of the IQ mixer ≥ 300 MHz from the carrier. The poles of all filters are adjusted such that optimum attenuation of the unwanted mixing products and optimum amplitude distortion in the passband (± 30 MHz) are obtained. In the passband, the filters provide a typical amplitude distortion of < 0.025 dB/MHz and a typical group delay of < 15 ps/MHz.

The filters are set using the three tuning voltages IQFIL1, IQFIL2 and IQFIL3. The set voltage applies only for the currently operating filter. The tuning voltage ranges from 0 to 21 V and provides 8-bit resolution. The filter setting values are obtained with board pretesting and stored in the EERPOM (D17, sheet 14 of circuit diagram).

New calibration of the filters is only required, if filter parts have to be replaced.

7.1.6.1 1st Filter 750 to 1800 MHz

(sheets 7 and 8 of circuit diagram)

The first filter mainly provides a lowpass character, since the critical frequencies are above the carrier. It contains three identical lowpass filters, which are tuned by means of the capacity diodes V166-V169, V171 -V172 and V213-V215.

A tunable highpass filter incorporated in the capacity diodes V170 and V189-V190 is located between the second and the third lowpass filter. It attenuates the spurious below the carrier. Another highpass filter with a cut-off frequency of 700 MHz is provided at the output of this filter path in order to suppress fixed mixing products.

Buffer amplifiers (GaAs-Fet MMIC's N12-N14 and N21) provided between the filters for decoupling purposes. Gain adjustment in this filter path is accomplished via a pin-diode control element by means of the potentiometer R692. The attenuation of the latter depends on the temperature (R549) and compensates the typical level temperature response.

Three of the four buffer amplifiers are switched off by the power supply if the filter is not in operation.

7.1.6.2 2nd Filter 1800 to 2500 MHz

(sheets 9 and 10 of circuit diagram)

The second IQ filter mainly provides a highpass function, since the upper sideband of mixing is used. It consists of three identical 5th-order highpass filters the poles of which are tuned via the capacity diodes V187-V188, V164-V165, V218 and V212.

A tunable lowpass filter (capacity diodes V161-V163) provides for attenuation of the mixing products above the upper sideband. A fixed, printed lowpass filter with a cut-off frequency of approx. 2600 MHz at the filter output suppresses the 2nd and 3rd-order LO mixing products.

The traveling-wave amplifier V91-V93 and the MMIC amplifiers N10, N11 and N20 are used as buffer stages between the filters. R691 is provided for level adjustment in this filter.

7.1.6.3 3rd Filter 2500 to 3300 MHz

(sheets 11 and 12 of circuit diagram)

Filter 3 is set up similar to filter 2. The three highpass filters are tuned by the capacity diodes V173-V176 and V216-V217. The tunable lowpass filter is located at the filter output and is adjusted via the diodes V177-V179. It is decoupled via the amplifiers V94-V96, N15-N16 and N22.

7.1.6.4 RF Switch for the IQ Filters

(sheets 6 and 13 of circuit diagram)

Pin-diode switches are provided (V19, V22 and V202 at the filter input and V49-V53 at the filter output).

The current required for biased operation of the diodes is supplied by the operational amplifiers N4 and N5 (signals IQCH1, IQCH2 and IQCH3).

7.1.7 Output Unit and CW Level Control

(sheet 13 of circuit diagram)

The required 4-dBm output level is generated by the two amplifier stages N23 and V108, the MMIC amplifier N23 being provided in the IQ path, only.

The selector switch for selection between IQ or CW mode (pin diode switch V46-V48) is accommodated between the amplifiers.

In CW mode, the level detector (V61) following the final amplifier controls the output level which must assume a fixed value. N19-1 is used as difference amplifier which amplifies the detected RF voltage, N19-2 functions as PI control amplifier. The pin-diode modulator of the LO level control works as level control element (cf. 7.1.3). The rated output level is set using the potentiometer R495. The two paths can be switched over via the integrated switch D3.

In IQ mode, the level detector V61 is used for level-préset calibration (cf. 7.1.5).

7.4 Testing and Adjustment

All measured values given without tolerances are recommended values. Voltages given without further information mean DC voltages.

The service kit contains an adaptor to make the module accessible. The adaptor is plugged into the chassis instead of the module and the RF connections at X221 and X223 are connected. A measurement cable is connected to the RF output X227. Then, the module can be plugged into the adaptor.

Prior to each test, a PRESET on the instrument causes the module to assume a defined state. If no further information is given with frequency settings, CW operation is assumed.

Tests in IQ mode (VECTOR MOD:STATE ON) require a voltage of 0.5 ± 0.01 V to be applied to the front unit.

7.4.1 Testing Data Transmission and Power Supply

(cf. sheets 14-17 of circuit diagram)

According to the instrument standard, the IQCON module is controlled via a serial interface using the SERBUS-D component. Data for setting the module are transmitted via subaddress 1. The second subaddress is provided for data traffic with the EEPROM, which contains the complete calibration data for filter control. The MSB is first transmitted for board setting and is applied at Q8 (pin 11) of the corresponding latch. Settings and associated data are given in Section 7.4.7.3.

The power consumption of the module can be checked by looping in an ammeter instead of the coils L3, L4, L5, L304 and L305 (7.6). The most important reference and supply voltages are checked using a DC voltmeter.

For checking the LO input with vector modulation switched on, the control voltage can be checked via diagnosis 2013 (7.4.7.1). A 0.5-V DC voltage must be applied to the I or Q input on the front panel to enable generation of the required IF level. The 300-MHz signal can be measured at the output X242 of the IQ modulator.

7.4.6.4 Filter Calibration and Level Adjustment of the IQ Filters

New filter calibration can only be performed in the factory Memmingen (Board Pretest). This is, however, only required, after replacing either capacity diodes in the IQ filters or the EEPROM containing the calibration data.

Each new calibration must be followed by a level adjustment of the filters. For this purpose, the potentiometers R691-R693 are provided, which allow for adjusting the levels of the three filters to each other. They must not be varied in normal operation.

7.4.7.3 Digital Interface

(cf. sheets 14 + 15 of circuit diagram)

The IQCON module is set via a serial interface using the SERBUS-D component, according to the instrument standard. The data for the serial shift registers for the HC4094-Latches are strobed by strobe 1 (SERWR1).

The second subaddress is provided for communication with the onboard EEPROM. The latter contains the tuning values for all tunable filters obtained with filter calibration. The data format corresponds to the R&S standard. External access to the filters is not possible which is why they are not mentioned.

7.4.7.4 Typical RF Levels

Conditional testing of the RF paths is possible only by connecting an RF probe to the spectrum analyzer. Make sure to have a short ground connection at low impedance. The series impedance of the probe should amount to 1 kOhm. The indicated values are typical values. The measurements are performed at lowest possible frequencies. The measurements are taken subsequent to the coupling capacitor of the indicated amplifier stage.

7. Testing and Repair of the Module

7.1 Function Description

The IQ Modulator module is divided into the three function units LF Generator, vector modulator and output unit.

The LF Generator is provided as internal modulation signal for FM/PM or AM, but it is also provided at a separate output 'LF out'.

The IQ modulator generates a vector-modulated 300-MHz signal which is required on the IQ converter board for synthesis of a vector-modulated RF carrier. Power ramping, which is necessary for digital mobile radio networks is accomplished by means of an additional amplitude modulator of large bandwidth. Another level control element with a digital control signal allows for fast level attenuation of up to 70 dB for alternative level setting in the time slots. Pulse modulation with an ON/OFF ratio > 80dB is implemented by means of two fast GaAs switches.

The output unit comprises the complete level conditioning and the AM modulator for the output frequency range up to 3.3 GHz. The frequency range below 450 MHz in CW mode or 750 MHz in IQ mode is generated by down-conversion using a 2.4-GHz signal. In CW mode, output signals above 3040 MHz are obtained by up-conversion with the 300-MHz signal of the vector modulator.

7.1.1 LF Generator

The LF Generator supplies a sinewave signal with a frequency which can be set between 0.1 Hz and 1 MHz. The signal is provided at the 'INT1' line with an amplitude of 1 V. In addition, the level from 1 mV to 4V peak can be selected at the output 'LFOUT'.

A Direct Digital Synthesis is the nucleus of the LF generator. The reference frequency of the DDS is 50 MHz. The increment can be set by a 32-bit value. The integrated DA converter provides a 10-bit resolution. All internal registers are assigned '0' by means of a reset component. With power off, the component operates in 'sleep mode' in order to reduce power consumption.

The DDS component supplies a sinewave with a constant amplitude of 2V peak-to-peak and a dc offset of 1V. The summing module N11 adds a constant voltage to the output signal to compensate for the offset. Offset adjustment is performed via R124. The output signal N11 is used as internal modulation signal on 'INT1'.

Level conditioning for the LF output 'LFOUT' follows using the 12-bit DA converter N41. The output amplifier N10 increases the voltage range to 4V peak.

7.1.2 Output Unit

7.1.2.1 Amplitude Modulator and Preset

The output signal 'IQFIL' of the IQ converter is first applied to the level preset element V9. Thus, the AM modulator can operate at its ideal operating point independent of the level set. The control voltage 'V_PRESET' which is set via the 8-bit converter U1 is obtained by the internal preset calibration depending on the output frequency and the output level. A difference amplifier V38/V40 with the current source V39 provides for a constant current through the pin diodes in IQ-Off and ALC-OFF modes and thus for a temperature-stabilized attenuation value.

The RF signal passes to the AM modulator V3/V4/V8 via the broadband amplifier V102. Similar to the preset element, this signal is controlled via a difference amplifier V41/V56 with the current source V42 to ensure high temperature-stability with clamped level. The insertion loss of the modulator is compensated by the RF amplifier N4.

7.1.2.2 Output Amplifier

The GaAs-switches D55 and D56 route the RF signal either directly to the output amplifier or to the RF input of the down-converter to generate the frequency range below 450 MHz. The pin diodes V108/V110/V170/V171 improve crosstalk in the down-converter mode to better 80dB. They are controlled via the operational amplifier N6.

The 3-stage output amplifier V144/V103/V104 increases the level up to 19 dBm. The working point of the GaAs-Fets is stabilized by the current source V1/V2/V6 for the drain current and a control for the drain voltage through N1/N2.

A harmonic filter which follows the output amplifier V104 improves the harmonics suppression for output frequencies above 1.8 GHz.

A directional coupler consisting of the resistors R511, R902 and R922, applies part of the output power to the peak rectifier V46. The latter is accordingly broadband to cover the complete frequency range. A second charging capacitor C549 can be switched on in addition for output frequencies below 5 MHz. The detector characteristic is linearized using the log module N39, N40 and N41.

The balancing transformer T1 decouples the output power at the floating gate of the transformer.

7.1.2.3 Down-conversion

The frequency range below 450 MHz is obtained on the output unit by down-conversion with a 2.4-GHz LO signal. The GaAs switch D56 passes the modulated RF signal to the RF gate of the diode mixer U9. The IF amplifier V148 amplifies the IF signal by approx. 15dB. A succeeding filter suppresses unwanted mixing products such as $3 \cdot \text{LO} - 2 \cdot \text{RF}$, and the LO frequency

7.1.2.4 LO Synthesis

The LO signal for mixing is derived from the 600-MHz signal of the step synthesis in the 2.4-GHz PLL consisting of the VCO V130, L108, C452 and V111, the divider :4 D44, the phase detector and the PI control N14.

A power divider R291/R294/R293 at the VCO output decouples part of the power and applies it to the LO gate of the mixer U9 via the LO amplifier stages V154, V147 and V99. The control element for the pin diodes is used to adjust the LO level to approx. 17 dBm on the mixer. With mixer active, the amplifier stages V154, V147 and V99 are switched off via their supply voltage.

7.1.2.5 Level Conditioning

The command value of level control is given by the 12-bit converter 'LEVEL' D43. The controller of the level control loop N35 allows for selection between two control bandwidths (switch D15). The narrow bandwidth of approx. 5kHz is used in CW mode, the broad one of approx. 20 kHz with AM modulation. For carrier frequencies below 5 MHz the control is always switched slow.

Electronic level blanking is accomplished by the offset current applied via R316 and switched by the signal 'Klemm_N'. The level is thus prevented from increasing too much after level gaps occurring with change of frequency.

In IQ and ALC OFF modes, the switch D15 and the control signal 'ALC_ON' are used to switch over the controller N35 to the AF amplifier. In addition, the measured value of the level detector must be disconnected via the switch D8.

AM is performed using an externally applied modulation signal 'EXT1' or internally by means of the 'INT1' signal of the LF generator. Two-tone modulation is achieved by simultaneous modulation with both signals. Either ac coupling (coupling capacitor C606/C607) or dc coupling may be selected for the externally applied modulation signal. Selection is made via switches D9 and D10.

A window comparator N42 monitors the modulation signal with AM with ac coupling to the rated value of 1V peak and supplies an interrupt which is triggered if the deviation from the rated value exceeds 3%. The interrupt triggers a warning message in the display.

The modulation depth is set by the 12-bit DA converter 'AMOD' D42. Its output signal is added to a fixed dc reference 'AM-6V' and is used as reference for the DA converter 'LEVEL' D43 of level setting.

7.1.3 Vector Modulator

7.1.3.1 LO Conditioning and Modulator

The vector modulator operates at a fixed frequency of 300 MHz. The 300-MHz signal is obtained from the 600-MHz reference of step synthesis by means of division (:2 divider N28). A 3-stage LO driver V82, V81 and V83 amplifies the signal at the divider output to approx. 25 dBm and passes it to the 90° power divider B1.

The latter generates two 300-MHz carriers with a phase relation of 90° . The phase relation may be varied by $\pm 20^\circ$ via a tunable phase shifter V123/V125/V122/V124 in the I-path or L50, V127/V126/V128/V129 in the Q-path, each.

The 300-MHz signals are amplified to approx. 17 dBm via the LO drivers V75 and V77 and applied to the LO input of the I-mixer U11 or of the Q-mixer U12. The modulated signal is first amplified at the RF output of the modulation mixer by means of the amplifiers N46 and N47 and then subject to a harmonic filter. The addition of the modulated signals of the I and Q paths is carried out by the 0° -power summer U4.

7.1.3.2 Level Attenuation

After the addition, the modulated signal is applied to two pin diode attenuators V50, V52 and V53, V71 which are separated by an amplifier N45. The attenuators allow for fast level attenuation by 0 to 70 dB. (transient < 15 μ s)

With digital modulations, the control elements are used for fast level attenuation in particular time slots (control via input 'X240 A10' 'LEVATT_MOD') and as electronic attenuator in the operating mode 'LEVEL LEVEL ATTENUATOR MODE ELECTRONIC'.

In the operating mode without level attenuation, two current sources V78 and V76 ensure a constant current of approx. 1mA through the pin diodes. Potentiometer R2 permits to adjust the level at the output X242 by varying this current. N37 is out of operation in this case.

In the operating mode with level attenuation, a current depending on the voltage V_LEVATT is set by means of N37. The DA converter D46 'LEVATT' permits to vary the voltage V_LEVATT for setting the attenuation. To determine the converter setting for a desired attenuation value, the IQ detector is used in conjunction with an internally executed calibration routine. (UTILITIES CALIB LEV ATT)

The 0-dB setting for the operating mode with level attenuation is adjusted using potentiometer R1111 such that a DA converter value of approx. 3500 is obtained. The NTC resistor R1129 is used for compensation of the temperature-dependent attenuation of the control elements.

Switchover between impressed current and controlled current is effected by means of switches D12 and D13, both control elements being switched at the same time.

7.1.3.3 Pulse Modulation

Pulse modulation is enabled by switches D50 und D51. The conversion of the TTL signal to the control signal of the GaAs switches (0V <-> -6V) is made using transistors V134, V136, V158, V159. The inverter D7 permits to invert the pulse polarity.

7.1.3.4 Power Ramping

Linear power ramping is performed by means of the two analog multipliers in the I and Q path.

To increase the dynamic range of the assembly to >80dB, the switch to the IQ detector D28 is actuated with approx. -40dB attenuation. A comparator

N30 derives the control signal for the switch D28 from the command value of N24.

The linearity of the burst modulator up to an attenuation of approx. 30 dB is adjusted via Poti R807.

With switch D5 the burst control input can be switched off and the command value be replaced by an internally generated reference voltage.

Following the switch D28, the 300-MHz signal is passed via a harmonic filter and a power divider to the two outputs 'IQAUX' X241 and 'IQ300' X242. The signal 'IQAUX' provides the signal at the rear panel of the instrument, while 'IQ300' passes the signal to the 'IQ-Converter' module.

7.1.3.5 IQ Detector

The GaAs switch D28 allows for routing the signal of the IQ modulator to the level detector V106. The linearization circuit consists of the opamps N25 and N32.

The IQ detector is used for calibrating the IQ modulator and for determination of the level-attenuation setting.

7.1.3.6 IQ Modulation Path

The I and/or Q-modulation signals are applied to the 50- Ω termination R370/R369 and/or R372/R371 via the GaAs switches D37 and D54. The switches allow for applying known dc voltages to the modulation inputs for calibration purposes, for operating modes broadband-AM, pulse modulation, and for frequencies above 3040 MHz.

The voltages available are $\pm 1V$ for calibration of the IQ imbalance, $\pm 0.707V$ for the quadrature offset and 0V for residual carrier calibration. Two analog multiplexers D16 and D17 allow for selection of the desired calibration reference. The opamp N19 measures the voltages at D17 and D16 and supplies the required current for the 50- Ω load.

The video multiplexer D40 allows for exchanging the I-channel and the Q-channel. This is necessary, since both sidebands occurring with up-conversion in the IQ converter or down-conversion in the output unit are used to avoid spurious. The exchange may also be made via the firmware.

One analog multiplier D1 in the I-channel and one (D2) in the Q-channel are provided for individual level setting. Two 8-bit DA converters 'ILEV' U2 and 'QLEV' U3 ensure the setting range of approx. $\pm 25\%$. Definite variation of the IQ imbalance via the firmware is thus possible as well as adjustment during IQ calibration.

Switching the AM-reference input to the ILev or QLev entries of the multipliers by means of D11 allows an AM during IQ-operation (IQAM). Since power ramping is also implemented with the aid of the multipliers, power ramping and IQAM exclude each other.

The DC offset applied to the Y2 input of the two multipliers permits to compensate for offsets produced ahead of the multiplier. The twofold 12-bit DA converter D61 is available for this purpose. The required calibration is performed internally with the vector modulator calibration.

The dc offset fed at the Z-input of the two multipliers compensates the residual carrier or it is set via the firmware. To this end, two 12-bit

DA converters 'IOFFSET' D45 and 'QOFFSET' D48 are available. With broadband AM, the residual carrier at the I-channel is set to 50% via the DA converter 'IOFFSET'.

The third adjustment quantity, the quadrature, is set using the 12-bit converter 'IQPHASE' D47 and influences directly the phase shifters in the RF path of the LO signal preceding the modulation mixers for I and Q. The opamp N18 is used to derive two negative-phase sequence tuning voltages from the converter output voltage, one of them being passed to the phase shifter in the Q-path, consisting of V126 to V129. The other one is passed to the phase shifter in the I-path which consists of V122 to V125.

7.1.3.7 Option B47 (IQ Filter)

If the module is enabled for Option B47, the I and Q signals are filtered after the analog multipliers either by a 850-kHz lowpass, 2.5-MHz lowpass, 5-MHz lowpass or 70-MHz lowpass (IQ_FILTER 850kHz, 2.5MHz, 5MHz or OFF). The two paths are switched by means of FETs which are driven by D59 and N4.

- Measure noise level at 305MHz in dBm/Hz
(With noise levels below -150dBm/Hz the measured value of the FSE should be corrected by the inherent noise of the analyzer!!)
- Check the signal-to-noise ratio = 'REF' - noise level to
greater than 139dBc/Hz (without Option B47)
greater than 148dBc/Hz (with Option B47)

Diagnosis

The board contains 24 RF and dc test points in all. They are selected via the 'UTILITIES DIAG TPOINT POINT 21??' menu. The first two digits relate to the 'IQMOD' (21) board, the subsequent two digits are provided to number the diagnostic points.

IR=Supplies board interrupt, DF=divider factor, War=waiting time

Removal and Assembly

After opening the instrument, unlocking the board and disconnecting the RF connections at X241 to X249, the module can be removed from its slot. The screening covers of the board are screwed in the conventional way. When operating the instrument with open screening cover, make sure to close the resonator chamber M using an appropriate test cover.
